

# Package ‘Cyclops’

October 31, 2023

**Type** Package

**Title** Cyclic Coordinate Descent for Logistic, Poisson and Survival Analysis

**Version** 3.4.0

**Description** This model fitting tool incorporates cyclic coordinate descent and majorization-minimization approaches to fit a variety of regression models found in large-scale observational healthcare data. Implementations focus on computational optimization and fine-scale parallelization to yield efficient inference in massive datasets. Please see:  
Suchard, Simpson, Zorych, Ryan and Madigan (2013) <[doi:10.1145/2414416.2414791](https://doi.org/10.1145/2414416.2414791)>.

**License** Apache License 2.0

**LazyData** Yes

**Biarch** true

**URL** <https://github.com/ohdsi/cyclops>

**BugReports** <https://github.com/ohdsi/cyclops/issues>

**Depends** R (>= 3.5.0)

**Imports** rlang, Matrix, Rcpp (>= 0.12.12), Andromeda (>= 0.3.1), dplyr, methods, survival, bit64

**LinkingTo** Rcpp, RcppEigen (>= 0.3.2)

**Suggests** testthat, readr, MASS, gnm, ggplot2, microbenchmark, cmprsk

**NeedsCompilation** yes

**RoxygenNote** 7.2.3

**Encoding** UTF-8

**Author** Marc A. Suchard [aut, cre],  
Martijn J. Schuemie [aut],  
Trevor R. Shaddox [aut],  
Yuxi Tian [aut],  
Jianxiao Yang [aut],  
Eric Kawaguchi [aut],  
Sushil Mittal [ctb],

Observational Health Data Sciences and Informatics [cph],  
 Marcus Geelnard [cph, ctb] (provided the TinyThread library),  
 Rutgers University [cph, ctb] (provided the HParSearch routine),  
 R Development Core Team [cph, ctb] (provided the ZeroIn routine)

**Maintainer** Marc A. Suchard <msuchard@ucla.edu>

**Repository** CRAN

**Date/Publication** 2023-10-31 00:50:02 UTC

coef.cyclopsFit	<i>Extract model coefficients</i>
-----------------	-----------------------------------

---

## Description

coef.cyclopsFit extracts model coefficients from an Cyclops model fit object

## Usage

```
## S3 method for class 'cyclopsFit'  
coef(object, rescale = FALSE, ignoreConvergence = FALSE, ...)
```

## Arguments

object	Cyclops model fit object
rescale	Boolean: rescale coefficients for unnormalized covariate values
ignoreConvergence	Boolean: return coefficients even if fit object did not converge
...	Other arguments

## Value

Named numeric vector of model coefficients.

---

confint.cyclopsFit	<i>Confidence intervals for Cyclops model parameters</i>
--------------------	--

---

## Description

confinit.cyclopsFit profiles the data likelihood to construct confidence intervals of arbitrary level. Usually it only makes sense to do this for variables that have not been regularized.

**Usage**

```
## S3 method for class 'cyclopsFit'
confint(
  object,
  parm,
  level = 0.95,
  overrideNoRegularization = FALSE,
  includePenalty = TRUE,
  rescale = FALSE,
  ...
)
```

**Arguments**

<code>object</code>	A fitted Cyclops model object
<code>parm</code>	A specification of which parameters require confidence intervals, either a vector of numbers of covariateId names
<code>level</code>	Numeric: confidence level required
<code>overrideNoRegularization</code>	Logical: Enable confidence interval estimation for regularized parameters
<code>includePenalty</code>	Logical: Include regularized covariate penalty in profile
<code>rescale</code>	Boolean: rescale coefficients for unnormalized covariate values
<code>...</code>	Additional argument(s) for methods

**Value**

A matrix with columns reporting lower and upper confidence limits for each parameter. These columns are labelled as  $(1 - \text{level}) / 2$  and  $1 - (1 - \text{level}) / 2$  in percent (by default 2.5 percent and 97.5 percent)

**Examples**

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,
                           model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",
                                      addIntercept = TRUE)

#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)
control <- createControl(cvType = "auto", noiseLevel = "quiet")

#Fit the model
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)

#Find out what the optimal hyperparameter was:
getHyperParameter(fit)
```

```
#Extract the current log-likelihood, and coefficients  
logLik(fit)  
coef(fit)  
  
#We can only retrieve the confidence interval for unregularized coefficients:  
confint(fit, c(0))
```

---

convertToCyclopsData    *Convert data from two data frames or ffdf objects into a CyclopsData object*

---

## Description

convertToCyclopsData loads data from two data frames or ffdf objects, and inserts it into a Cyclops data object.

## Usage

```
convertToCyclopsData(  
  outcomes,  
  covariates,  
  modelType = "lr",  
  addIntercept = TRUE,  
  checkSorting = NULL,  
  checkRowIds = TRUE,  
  normalize = NULL,  
  quiet = FALSE,  
  floatingPoint = 64  
)  
  
## S3 method for class 'data.frame'  
convertToCyclopsData(  
  outcomes,  
  covariates,  
  modelType = "lr",  
  addIntercept = TRUE,  
  checkSorting = NULL,  
  checkRowIds = TRUE,  
  normalize = NULL,  
  quiet = FALSE,  
  floatingPoint = 64  
)  
  
## S3 method for class 'tbl_dbi'  
convertToCyclopsData(  
  outcomes,
```

```

covariates,
modelType = "lr",
addIntercept = TRUE,
checkSorting = NULL,
checkRowIds = TRUE,
normalize = NULL,
quiet = FALSE,
floatingPoint = 64
)

```

## Arguments

<code>outcomes</code>	A data frame or fffd object containing the outcomes with predefined columns (see below).
<code>covariates</code>	A data frame or fffd object containing the covariates with predefined columns (see below).
<code>modelType</code>	Cyclops model type. Current supported types are "pr", "cpr", "lr", "clr", or "cox"
<code>addIntercept</code>	Add an intercept to the model?
<code>checkSorting</code>	(DEPRECATED) Check if the data are sorted appropriately, and if not, sort.
<code>checkRowIds</code>	Check if all rowIds in the covariates appear in the outcomes.
<code>normalize</code>	String: Name of normalization for all non-indicator covariates (possible values: stdev, max, median)
<code>quiet</code>	If true, (warning) messages are suppressed.
<code>floatingPoint</code>	Specified floating-point representation size (32 or 64)

## Details

These columns are expected in the outcome object:

<code>stratumId</code>	(integer)	(optional) Stratum ID for conditional regression models
<code>rowId</code>	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
<code>y</code>	(real)	The outcome variable
<code>time</code>	(real)	For models that use time (e.g. Poisson or Cox regression) this contains time (e.g. number of days)
<code>weights</code>	(real)	(optional) Non-negative weights to apply to outcome
<code>censorWeights</code>	(real)	(optional) Non-negative censoring weights for competing risk model; will be computed if not present

These columns are expected in the covariates object:

<code>stratumId</code>	(integer)	(optional) Stratum ID for conditional regression models
<code>rowId</code>	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
<code>covariateId</code>	(integer)	A numeric identifier of a covariate
<code>covariateValue</code>	(real)	The value of the specified covariate

**Value**

An object of type cyclopsData

**Methods (by class)**

- convertToCyclopsData(data.frame): Convert data from two data.frame
- convertToCyclopsData(tbl\_db): Convert data from two Andromeda tables

**Examples**

```
#Convert infert dataset to Cyclops format:
covariates <- data.frame(stratumId = rep(infert$stratum, 2),
                           rowId = rep(1:nrow(infert), 2),
                           covariateId = rep(1:2, each = nrow(infert)),
                           covariateValue = c(infert$spontaneous, infert$induced))
outcomes <- data.frame(stratumId = infert$stratum,
                        rowId = 1:nrow(infert),
                        y = infert$case)

#Make sparse:
covariates <- covariates[covariates$covariateValue != 0, ]

#Create Cyclops data object:
cyclopsData <- convertToCyclopsData(outcomes, covariates, modelType = "clr",
                                      addIntercept = FALSE)

#Fit model:
fit <- fitCyclopsModel(cyclopsData, prior = createPrior("none"))
```

**convertToTimeVaryingCoef**

*Convert short sparse covariate table to long sparse covariate table for time-varying coefficients.*

**Description**

convertToTimeVaryingCoef convert short sparse covariate table to long sparse covariate table for time-varying coefficients.

**Usage**

```
convertToTimeVaryingCoef(shortCov, longOut, timeVaryCoefId)
```

**Arguments**

- |                |  |
|----------------|--|
| shortCov       | A data frame containing the covariate with predefined columns (see below).                     |
| longOut        | A data frame containing the outcomes with predefined columns (see below), output of splitTime. |
| timeVaryCoefId | Integer: A numeric identifier of a time-varying coefficient                                    |

## Details

These columns are expected in the shortCov object:

<code>rowId</code>	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
<code>covariateId</code>	(integer)	A numeric identifier of a covariate
<code>covariateValue</code>	(real)	The value of the specified covariate

These columns are expected in the longOut object:

<code>stratumId</code>	(integer)	Stratum ID for time-varying models
<code>subjectId</code>	(integer)	Subject ID is used to link multiple covariates (x) at different time intervals to a single subject
<code>rowId</code>	(integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
<code>y</code>	(real)	The outcome variable
<code>time</code>	(real)	For models that use time (e.g. Poisson or Cox regression) this contains time (e.g. number of days)

## Value

A long sparse covariate table for time-varying coefficients.

`coverage`

*Coverage*

## Description

`coverage` computes the coverage on confidence intervals

## Usage

```
coverage(goldStandard, lowerBounds, upperBounds)
```

## Arguments

<code>goldStandard</code>	Numeric vector
<code>lowerBounds</code>	Numeric vector. Lower bound of the confidence intervals
<code>upperBounds</code>	Numeric vector. Upper bound of the confidence intervals

## Value

The proportion of times `goldStandard` falls between `lowerBound` and `upperBound`

---

```
createAutoGridCrossValidationControl
```

*Create a Cyclops control object that supports multiple hyperparameters*

---

## Description

`createCrossValidationControl` creates a Cyclops control object for use with [fitCyclopsModel](#) that supports multiple hyperparameters through an auto-search in one dimension and a grid-search over the remaining dimensions

## Usage

```
createAutoGridCrossValidationControl(  
  outerGrid,  
  autoPosition = 1,  
  refitAtMaximum = TRUE,  
  cvType = "auto",  
  initialValue = 1,  
  ...  
)
```

## Arguments

<code>outerGrid</code>	List or data.frame of grid parameters to explore
<code>autoPosition</code>	Vector position for auto-search parameter (concatenated into <code>outerGrid</code> )
<code>refitAtMaximum</code>	Logical: re-fit Cyclops object at maximal cross-validation parameters
<code>cvType</code>	Must equal "auto"
<code>initialValue</code>	Initial value for auto-search parameter
...	Additional parameters passed through to <code>createControl</code>

## Value

A Cyclops prior object of class inheriting from "cyclopsPrior" and "cyclopsFunctionalPrior" for use with [fitCyclopsModel](#).

---

```
createControl
```

*Create a Cyclops control object*

---

## Description

`createControl` creates a Cyclops control object for use with [fitCyclopsModel](#).

**Usage**

```
createControl(
  maxIterations = 1000,
  tolerance = 1e-06,
  convergenceType = "gradient",
  cvType = "auto",
  fold = 10,
  lowerLimit = 0.01,
  upperLimit = 20,
  gridSteps = 10,
  cvRepetitions = 1,
  minCVData = 100,
  noiseLevel = "silent",
  threads = 1,
  seed = NULL,
  resetCoefficients = FALSE,
  startingVariance = -1,
  useKKTswindle = FALSE,
  tuneSwindle = 10,
  selectorType = "auto",
  initialBound = 2,
  maxBoundCount = 5,
  algorithm = "ccd"
)
```

**Arguments**

<code>maxIterations</code>	Integer: maximum iterations of Cyclops to attempt before returning a failed-to-converge error
<code>tolerance</code>	Numeric: maximum relative change in convergence criterion from successive iterations to achieve convergence
<code>convergenceType</code>	String: name of convergence criterion to employ (described in more detail below)
<code>cvType</code>	String: name of cross validation search. Option "auto" selects an auto-search following BBR. Option "grid" selects a grid-search cross validation
<code>fold</code>	Numeric: Number of random folds to employ in cross validation
<code>lowerLimit</code>	Numeric: Lower prior variance limit for grid-search
<code>upperLimit</code>	Numeric: Upper prior variance limit for grid-search
<code>gridSteps</code>	Numeric: Number of steps in grid-search
<code>cvRepetitions</code>	Numeric: Number of repetitions of X-fold cross validation
<code>minCVData</code>	Numeric: Minimum number of data for cross validation
<code>noiseLevel</code>	String: level of Cyclops screen output ("silent", "quiet", "noisy")
<code>threads</code>	Numeric: Specify number of CPU threads to employ in cross-validation; default = 1 (auto = -1)

seed	Numeric: Specify random number generator seed. A null value sets seed via <a href="#">Sys.time</a> .
resetCoefficients	Logical: Reset all coefficients to 0 between model fits under cross-validation
startingVariance	Numeric: Starting variance for auto-search cross-validation; default = -1 (use estimate based on data)
useKKTSwindle	Logical: Use the Karush-Kuhn-Tucker conditions to limit search
tuneSwindle	Numeric: Size multiplier for active set
selectorType	String: name of exchangeable sampling unit. Option "byPid" selects entire strata. Option "byRow" selects single rows. If set to "auto", "byRow" will be used for all models except conditional models where the average number of rows per stratum is smaller than the number of strata.
initialBound	Numeric: Starting trust-region size
maxBoundCount	Numeric: Maximum number of tries to decrease initial trust-region size
algorithm	String: name of fitting algorithm to employ; default is ccd Todo: Describe convergence types

## Value

A Cyclops control object of class inheriting from "cyclopsControl" for use with [fitCyclopsModel](#).

## Examples

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,
                           model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",
                                      addIntercept = TRUE)

#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)
control <- createControl(cvType = "auto", noiseLevel = "quiet")

#Fit the model
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)

#Find out what the optimal hyperparameter was:
getHyperParameter(fit)

#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)

#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

---

createCyclopsData	<i>Create a Cyclops data object</i>
-------------------	-------------------------------------

---

### Description

`createCyclopsData` creates a Cyclops data object from an R formula or data matrices.

### Usage

```
createCyclopsData(
  formula,
  sparseFormula,
  indicatorFormula,
  modelType,
  data,
  subset = NULL,
  weights = NULL,
  censorWeights = NULL,
  offset = NULL,
  time = NULL,
  pid = NULL,
  y = NULL,
  type = NULL,
  dx = NULL,
  sx = NULL,
  ix = NULL,
  model = FALSE,
  normalize = NULL,
  floatingPoint = 64,
  method = "cyclops.fit"
)
```

### Arguments

<code>formula</code>	An object of class " <a href="#">formula</a> " that provides a symbolic description of the numerically dense model response and terms.
<code>sparseFormula</code>	An object of class " <a href="#">formula</a> " that provides a symbolic description of numerically sparse model terms.
<code>indicatorFormula</code>	An object of class " <a href="#">formula</a> " that provides a symbolic description of {0,1} model terms.
<code>modelType</code>	character string: Valid types are listed below.
<code>data</code>	An optional data frame, list or environment containing the variables in the model.
<code>subset</code>	Currently unused
<code>weights</code>	Currently unused

censorWeights	Vector of subject-specific censoring weights (between 0 and 1). Currently only supported in modelType = "fgr".
offset	Currently unused
time	Currently undocumented
pid	Optional vector of integer stratum identifiers. If supplied, all rows must be sorted by increasing identifiers
y	Currently undocumented
type	Currently undocumented
dx	Optional dense "Matrix" of covariates
sx	Optional sparse "Matrix" of covariates
ix	Optional {0,1} "Matrix" of covariates
model	Currently undocumented
normalize	String: Name of normalization for all non-indicator covariates (possible values: stdev, max, median)
floatingPoint	Integer: Floating-point representation size (32 or 64)
method	Currently undocumented

## Details

This function creates a Cyclops model data object from R "[formula](#)" or directly from numeric vectors and matrices to define the model response and covariates. If specifying a model using a "[formula](#)", then the left-hand side define the model response and the right-hand side defines dense covariate terms. Objects provided with "[sparseFormula](#)" and "[indicatorFormula](#)" must be include left-hand side responses and terms are coersed into sparse and indicator representations for computational efficiency.

Items to discuss:

- Only use formula or (y,dx,...)
- stratum() in formula
- offset() in formula
- when "stratum" (renamed from pid) are necessary
- when "time" are necessary

## Value

A list that contains a Cyclops model data object pointer and an operation duration

## Models

Currently supported model types are:

"ls"	Least squares
"pr"	Poisson regression
"lr"	Logistic regression

<code>"clr"</code>	Conditional logistic regression
<code>"cpr"</code>	Conditional Poisson regression
<code>"scs"</code>	Self-controlled case series
<code>"cox"</code>	Cox proportional hazards regression
<code>"fgr"</code>	Fine-Gray proportional subdistribution hazards regression

## Examples

```
## Dobson (1990) Page 93: Randomized Controlled Trial :
counts <- c(18, 17, 15, 20, 10, 20, 25, 13, 12)
outcome <- gl(3, 1, 9)
treatment <- gl(3, 3)
cyclopsData <- createCyclopsData(
  counts ~ outcome + treatment,
  modelType = "pr")
cyclopsFit <- fitCyclopsModel(cyclopsData)

cyclopsData2 <- createCyclopsData(
  counts ~ outcome,
  indicatorFormula = ~ treatment,
  modelType = "pr")
summary(cyclopsData2)
cyclopsFit2 <- fitCyclopsModel(cyclopsData2)
```

## `createNonSeparablePrior`

*Create a Cyclops prior object that returns the MLE of non-separable coefficients*

## Description

`createNonSeparablePrior` creates a Cyclops prior object for use with [fitCyclopsModel](#).

## Usage

```
createNonSeparablePrior(maxIterations = 10, ...)
```

## Arguments

<code>maxIterations</code>	Numeric: maximum iterations to achieve convergence
<code>...</code>	Additional argument(s) for <a href="#">fitCyclopsModel</a>

## Value

A Cyclops prior object of class inheriting from `"cyclopsPrior"` for use with [fitCyclopsModel](#).

## Examples

```
prior <- createNonSeparablePrior()
```

---

### createParameterizedPrior

*Create a Cyclops parameterized prior object*

---

## Description

`createParameterizedPrior` creates a Cyclops prior object for use with `fitCyclopsModel` in which arbitrary R functions parameterize the prior location and variance.

## Usage

```
createParameterizedPrior(  
  priorType,  
  parameterize,  
  values,  
  useCrossValidation = FALSE,  
  forceIntercept = FALSE  
)
```

## Arguments

<code>priorType</code>	Character vector: specifies prior distribution. See below for options
<code>parameterize</code>	Function list: parameterizes location and variance
<code>values</code>	Numeric vector: initial parameter values
<code>useCrossValidation</code>	Logical: Perform cross-validation to determine parameters.
<code>forceIntercept</code>	Logical: Force intercept coefficient into prior

## Value

A Cyclops prior object of class inheriting from "cyclopsPrior" and "cyclopsFunctionalPrior" for use with `fitCyclopsModel`.

---

createPrior	<i>Create a Cyclops prior object</i>
-------------	--------------------------------------

---

## Description

`createPrior` creates a Cyclops prior object for use with [fitCyclopsModel](#).

## Usage

```
createPrior(
  priorType,
  variance = 1,
  exclude = c(),
  graph = NULL,
  neighborhood = NULL,
  useCrossValidation = FALSE,
  forceIntercept = FALSE
)
```

## Arguments

<code>priorType</code>	Character: specifies prior distribution. See below for options
<code>variance</code>	Numeric: prior distribution variance
<code>exclude</code>	A vector of numbers or covariateId names to exclude from prior
<code>graph</code>	Child-to-parent mapping for a hierarchical prior
<code>neighborhood</code>	A list of first-order neighborhoods for a partially fused prior
<code>useCrossValidation</code>	Logical: Perform cross-validation to determine prior variance.
<code>forceIntercept</code>	Logical: Force intercept coefficient into prior

## Value

A Cyclops prior object of class inheriting from "cyclopsPrior" for use with [fitCyclopsModel](#).

## Prior types

We specify all priors in terms of their variance parameters. Similar fitting tools for regularized regression often parameterize the Laplace distribution in terms of a rate "lambda" per observation. See "glmnet", for example.

`variance = 2 * / (nobs * lambda)^2` or `lambda = sqrt(2 / variance) / nobs`

## Examples

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,
                           model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",
                                      addIntercept = TRUE)

#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)
control <- createControl(cvType = "auto", noiseLevel = "quiet")

#Fit the model
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)

#Find out what the optimal hyperparameter was:
getHyperParameter(fit)

#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)

#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

### createWeightBasedSearchControl

*Create a Cyclops control object that supports in- / out-of-sample hyperparameter search using weights*

## Description

createWeightBasedSearchControl creates a Cyclops control object for use with [fitCyclopsModel](#) that supports hyperparameter optimization through an auto-search where weight = 1 identifies in-sample observations and weight = 0 identifies out-of-sample observations.

## Usage

```
createWeightBasedSearchControl(cvType = "auto", initialValue = 1, ...)
```

## Arguments

cvType	Must equal "auto"
initialValue	Initial value for auto-search parameter
...	Additional parameters passed through to <a href="#">createControl</a>

## Value

A Cyclops prior object of class inheriting from "cyclopsControl" for use with [fitCyclopsModel](#).

cyclops

*Cyclops: Cyclic coordinate descent for logistic, Poisson and survival analysis***Description**

The Cyclops package incorporates cyclic coordinate descent and majorization-minimization approaches to fit a variety of regression models found in large-scale observational healthcare data. Implementations focus on computational optimization and fine-scale parallelization to yield efficient inference in massive datasets.

**fitCyclopsModel***Fit a Cyclops model***Description**

`fitCyclopsModel` fits a Cyclops model data object

**Usage**

```
fitCyclopsModel(
  cyclopsData,
  prior = createPrior("none"),
  control = createControl(),
  weights = NULL,
  forceNewObject = FALSE,
  returnEstimates = TRUE,
  startingCoefficients = NULL,
  fixedCoefficients = NULL,
  warnings = TRUE,
  computeDevice = "native"
)
```

**Arguments**

<code>cyclopsData</code>	A Cyclops data object
<code>prior</code>	A prior object. More details are given below.
<code>control</code>	A "cyclopsControl" object constructed by <code>createControl</code>
<code>weights</code>	Vector of 0/1 weights for each data row
<code>forceNewObject</code>	Logical, forces the construction of a new Cyclops model fit object
<code>returnEstimates</code>	Logical, return regression coefficient estimates in Cyclops model fit object
<code>startingCoefficients</code>	Vector of starting values for optimization

```

fixedCoefficients          Vector of booleans indicating if coefficient should be fix
warnings                  Logical, report regularization warnings
computeDevice   String: Name of compute device to employ; defaults to "native" C++ on CPU

```

## Details

This function performs numerical optimization to fit a Cyclops model data object.

## Value

A list that contains a Cyclops model fit object pointer and an operation duration

## Prior

Currently supported prior types are:

"none"	Useful for finding MLE
"laplace"	L_1 regularization
"normal"	L_2 regularization

## Examples

```

## Dobson (1990) Page 93: Randomized Controlled Trial :
counts <- c(18,17,15,20,10,20,25,13,12)
outcome <- gl(3,1,9)
treatment <- gl(3,3)
cyclopsData <- createCyclopsData(counts ~ outcome + treatment, modelType = "pr")
cyclopsFit <- fitCyclopsModel(cyclopsData, prior = createPrior("none"))
coef(cyclopsFit)
confint(cyclopsFit, c("outcome2","treatment3"))
predict(cyclopsFit)

```

---

`fitCyclopsSimulation` *Fit simulated data*

---

### Description

`fitCyclopsSimulation` fits simulated Cyclops data using Cyclops or a standard routine. This function is useful for simulation studies comparing the performance of Cyclops when considering large, sparse datasets.

### Usage

```
fitCyclopsSimulation(
  sim,
  useCyclops = TRUE,
  model = "logistic",
  coverage = TRUE,
  includePenalty = FALSE
)
```

### Arguments

<code>sim</code>	A simulated Cyclops dataset generated via <code>simulateCyclopsData</code>
<code>useCyclops</code>	Logical: use Cyclops or a standard routine
<code>model</code>	String: Fitted regression model type
<code>coverage</code>	Logical: report coverage statistics
<code>includePenalty</code>	Logical: include regularized regression penalty in computing profile likelihood based confidence intervals

---

`getCovariateIds` *Get covariate identifiers*

---

### Description

`getCovariateIds` returns a vector of integer64 covariate identifiers in a Cyclops data object

### Usage

```
getCovariateIds(object)
```

### Arguments

<code>object</code>	A Cyclops data object
---------------------	-----------------------

---

getCovariateTypes      *Get covariate types*

---

**Description**

getCovariateTypes returns a vector covariate types in a Cyclops data object

**Usage**

```
getCovariateTypes(object, covariateLabel)
```

**Arguments**

object            A Cyclops data object  
covariateLabel   Integer vector: covariate identifiers to return

---

getCyclopsProfileLogLikelihood  
    *Profile likelihood for Cyclops model parameters*

---

**Description**

getCyclopsProfileLogLikelihood evaluates the profile likelihood at a grid of parameter values.

**Usage**

```
getCyclopsProfileLogLikelihood(  
    object,  
    parm,  
    x = NULL,  
    bounds = NULL,  
    tolerance = 0.001,  
    initialGridSize = 10,  
    includePenalty = TRUE  
)
```

**Arguments**

object            Fitted Cyclops model object  
parm             Specification of which parameter requires profiling, either a vector of numbers of covariateId names  
x                Vector of values of the parameter  
bounds            Pair of values to bound adaptive profiling  
tolerance        Absolute tolerance allowed for adaptive profiling

---

**initialGridSize**  
Initial grid size for adaptive profiling  
**includePenalty** Logical: Include regularized covariate penalty in profile

**Value**

A data frame containing the profile log likelihood. Returns NULL when the adaptive profiling fails to converge.

---

<b>getFineGrayWeights</b>	<i>Creates a Surv object that forces in competing risks and the IPCW needed for Fine-Gray estimation.</i>
---------------------------	---

---

**Description**

`getFineGrayWeights` creates a list `Surv` object and vector of weights required for estimation.

**Usage**

```
getFineGrayWeights(ftime, fstatus, cencode = 0, failcode = 1)
```

**Arguments**

<code>ftime</code>	Numeric: Observed event (failure) times
<code>fstatus</code>	Numeric: Observed event (failure) types
<code>cencode</code>	Numeric: Code to denote censored observations (Default is 0)
<code>failcode</code>	Numeric: Code to denote event of interest (Default is 1)

**Value**

A list that returns both an object of class `Surv` that forces in the competing risks indicators and a vector of weights needed for parameter estimation.

**Examples**

```
ftime <- c(1, 2, 3, 4, 5, 6, 7, 8, 9, 10)
fstatus <- c(1, 2, 0, 1, 2, 0, 1, 2, 0, 1)
getFineGrayWeights(ftime, fstatus, cencode = 0, failcode = 1)
```

---

```
getFloatingPointSize   Get floating point size
```

---

**Description**

getFloatingPointSize returns the floating-point representation size in a Cyclops data object

**Usage**

```
getFloatingPointSize(object)
```

**Arguments**

object	A Cyclops data object
--------	-----------------------

---

```
getHyperParameter   Get hyperparameter
```

---

**Description**

getHyperParameter returns the current hyper parameter in a Cyclops model fit object

**Usage**

```
getHyperParameter(object)
```

**Arguments**

object	A Cyclops model fit object
--------	----------------------------

**Examples**

```
#Generate some simulated data:  
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,  
                           model = "poisson")  
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",  
                                      addIntercept = TRUE)  
  
#Define the prior and control objects to use cross-validation for finding the  
#optimal hyperparameter:  
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)  
control <- createControl(cvType = "auto", noiseLevel = "quiet")  
  
#Fit the model  
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)  
  
#Find out what the optimal hyperparameter was:
```

```

getHyperParameter(fit)

#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)

#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))

```

**getNumberOfCovariates** *Get total number of covariates*

**Description**

`getNumberOfCovariates` returns the total number of covariates in a Cyclops data object

**Usage**

```
getNumberOfCovariates(object)
```

**Arguments**

<code>object</code>	A Cyclops data object
---------------------	-----------------------

**getNumberOfRows** *Get total number of rows*

**Description**

`getNumberOfRows` returns the total number of outcome rows in a Cyclops data object

**Usage**

```
getNumberOfRows(object)
```

**Arguments**

<code>object</code>	A Cyclops data object
---------------------	-----------------------

---

getNumberOfStrata	<i>Get number of strata</i>
-------------------	-----------------------------

---

### Description

getNumberOfStrata return the number of unique strata in a Cyclops data object

### Usage

```
getNumberOfStrata(object)
```

### Arguments

object	A Cyclops data object
--------	-----------------------

---

getUnivariableCorrelation	<i>Get univariable correlation</i>
---------------------------	------------------------------------

---

### Description

getUnivariableCorrelation reports covariates that have high correlation with the outcome

### Usage

```
getUnivariableCorrelation(cyclopsData, covariates = NULL, threshold = 0)
```

### Arguments

cyclopsData	A Cyclops data object
covariates	Integer or string vector: list of covariates to report; default (NULL) implies all covariates
threshold	Correlation threshold for reporting

### Value

A list of covariates whose absolute correlation with the outcome is greater than or equal to the threshold

**getUnivariableSeparability***Get univariable linear separability***Description**

`getUnivariableSeparability` reports covariates that are univariably separable with the outcome

**Usage**

```
getUnivariableSeparability(cyclopsData, covariates = NULL)
```

**Arguments**

- |                          |   |
|--------------------------|---|
| <code>cyclopsData</code> | A Cyclops data object   |
| <code>covariates</code>  | Integer or string vector: list of covariates to report; default (NULL) implies all covariates |

**Value**

A list of covariates that are univariably separable with the outcome

**isInitialized***Check if a Cyclops data object is initialized***Description**

`isInitialized` determines if an Cyclops data object is properly initialized and remains in memory. Cyclops data objects do not serialize/deserialize their back-end memory across R sessions.

**Usage**

```
isInitialized(object)
```

**Arguments**

- |                     |                             |
|---------------------|-----------------------------|
| <code>object</code> | Cyclops data object to test |
|---------------------|-----------------------------|

---

logLik.cyclopsFit      *Extract log-likelihood*

---

## Description

logLik returns the current log-likelihood of the fit in a Cyclops model fit object

## Usage

```
## S3 method for class 'cyclopsFit'  
logLik(object, ...)
```

## Arguments

object	A Cyclops model fit object
...	Additional arguments

## Examples

```
#Generate some simulated data:  
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,  
                           model = "poisson")  
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",  
                                    addIntercept = TRUE)  
  
#Define the prior and control objects to use cross-validation for finding the  
#optimal hyperparameter:  
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)  
control <- createControl(cvType = "auto", noiseLevel = "quiet")  
  
#Fit the model  
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)  
  
#Find out what the optimal hyperparameter was:  
getHyperParameter(fit)  
  
#Extract the current log-likelihood, and coefficients  
logLik(fit)  
coef(fit)  
  
#We can only retrieve the confidence interval for unregularized coefficients:  
confint(fit, c(0))
```

---

meanLinearPredictor     *Calculates xbar\*beta*

---

### Description

meanLinearPredictor computes xbar\*beta for model fit

### Usage

```
meanLinearPredictor(cyclopsFit)
```

### Arguments

cyclopsFit     A Cyclops model fit object

---

---

mse              *Mean squared error*

---

### Description

mse computes the mean squared error between two numeric vectors

### Usage

```
mse(goldStandard, estimates)
```

### Arguments

goldStandard     Numeric vector  
estimates        Numeric vector

### Value

MSE(goldStandard, estimates)

---

**Multitype***Create a multitype outcome object*

---

**Description**

Multitype creates a multitype outcome object, usually used as a response variable in a hierarchical Cyclops model fit.

**Usage**

```
Multitype(y, type)
```

**Arguments**

y	Numeric: Response count(s)
type	Numeric or factor: Response type

**Value**

An object of class Multitype with length equal to the length of y and type.

**Examples**

```
Multitype(c(0,1,0), as.factor(c("A","A","B")))
```

---

**oxford***Oxford self-controlled case series data*

---

**Description**

A dataset containing the MMR vaccination / meningitis in Oxford example from Farrington and Whitaker. There are 10 patients comprising 38 unique exposure intervals.

**Usage**

```
data(oxford)
```

## Format

A data frame with 38 rows and 6 variables:

**indiv** patient identifier  
**event** number of events in interval  
**interval** interval length in days  
**agegr** age group  
**exgr** exposure group  
**loginterval** log interval length ...

**predict.cyclopsFit** *Model predictions*

## Description

`predict.cyclopsFit` computes model response-scale predictive values for all data rows

## Usage

```
## S3 method for class 'cyclopsFit'
predict(object, newOutcomes, newCovariates, ...)
```

## Arguments

<code>object</code>	A Cyclops model fit object
<code>newOutcomes</code>	An optional data frame or Andromeda table object, similar to the object used in <code>convertToCyclopsData</code> .
<code>newCovariates</code>	An optional data frame or Andromeda table object, similar to the object used in <code>convertToCyclopsData</code> .
<code>...</code>	Additional arguments

**print.cyclopsData** *Print a Cyclops data object*

## Description

`print.cyclopsData` displays information about a Cyclops data model object.

## Usage

```
## S3 method for class 'cyclopsData'
print(x, show.call = TRUE, ...)
```

**Arguments**

- |           |   |
|-----------|---|
| x         | A Cyclops data model object   |
| show.call | Logical: display last call to construct the Cyclops data model object |
| ...       | Additional arguments  |

---

print.cyclopsFit      *Print a Cyclops model fit object*

---

**Description**

print.cyclopsFit displays information about a Cyclops model fit object

**Usage**

```
## S3 method for class 'cyclopsFit'  
print(x, show.call = TRUE, ...)
```

**Arguments**

- |           |   |
|-----------|---|
| x         | A Cyclops model fit object  |
| show.call | Logical: display last call to update the Cyclops model fit object |
| ...       | Additional arguments  |

---

readCyclopsData      *Read Cyclops data from file*

---

**Description**

readCyclopsData reads a Cyclops-formatted text file.

**Usage**

```
readCyclopsData(fileName, modelType)
```

**Arguments**

- |           |  |
|-----------|--|
| fileName  | Name of text file to be read. If fileName does not contain an absolute path, |
| modelType | character string: Valid types are listed below.                              |

**Details**

This function reads a Cyclops-formatted text file and returns a Cyclops data object. The first line of the file may start with '#', indicating that it contains header options. Valid header options are:

<code>row_label</code>	(assume file contains a numeric column of unique row identifiers)
<code>stratum_label</code>	(assume file contains a numeric column of stratum identifiers)
<code>weight</code>	(assume file contains a column of row-specific model weights, currently unused)
<code>offset</code>	(assume file contains a dense column of linear predictor offsets)
<code>bbr_outcome</code>	(assume logistic outcomes are encoded -1/+1 following BBR)
<code>log_offset</code>	(assume file contains a dense column of values $x_i$ for which $\log(x_i)$ is the offset)
<code>add_intercept</code>	(automatically include an intercept column of all 1s for each entry)
<code>indicator_only</code>	(assume all covariates 0/1-valued and only covariate name is given)
<code>sparse</code>	(force all BBR formatted covariates to be represented as sparse, instead of sparse-indicator, columns .. really only for debugging)
<code>dense</code>	(force all BBR formatted covariates to be represented as dense columns.. really only for debugging)

Successive lines of the file are white-space delimited and follow the format:

- [Row ID] {Stratum ID} [Weight] <Outcome> {Censored} {Offset} <BBR covariates>
- [optional]
  - <required>
  - {required or optional depending on model}

Bayesian binary regression (BBR) covariates are white-space delimited and generally in a sparse '<name>:<value>' format, where 'name' must (currently) be numeric and 'value' is non-zero. If option 'indicator\_only' is specified, then format is simply '<name>'. 'Row ID' and 'Stratum ID' must be numeric, and rows must be sorted such that equal 'Stratum ID' are consecutive. 'Stratum ID' is required for 'clr' and 'scs' models. 'Censored' is required for a 'cox' model. 'Offset' is (currently) required for a 'scs' model.

### Value

A list that contains a Cyclops model data object pointer and an operation duration

### Models

Currently supported model types are:

<code>"ls"</code>	Least squares
<code>"pr"</code>	Poisson regression
<code>"lr"</code>	Logistic regression
<code>"clr"</code>	Conditional logistic regression
<code>"cpr"</code>	Conditional Poisson regression
<code>"scs"</code>	Self-controlled case series
<code>"cox"</code>	Cox proportional hazards regression
<code>"fgr"</code>	Fine-Gray proportional subdistribution hazards regression

## Examples

```
## Not run:
dataPtr = readCyclopsData(system.file("extdata/infert_ccd.txt", package="Cyclops"), "clr")

## End(Not run)
```

**simulateCyclopsData** *Simulation Cyclops dataset*

## Description

`simulateCyclopsData` generates a simulated large, sparse data set for use by `fitCyclopsSimulation`.

## Usage

```
simulateCyclopsData(
  nstrata = 200,
  nrows = 10000,
  ncovars = 20,
  effectSizeSd = 1,
  zeroEffectSizeProp = 0.9,
  eCovarsPerRow = ncovars/100,
  model = "survival"
)
```

## Arguments

<code>nstrata</code>	Numeric: Number of strata
<code>nrows</code>	Numeric: Number of observation rows
<code>ncovars</code>	Numeric: Number of covariates
<code>effectSizeSd</code>	Numeric: Standard derivation of the non-zero simulated regression coefficients
<code>zeroEffectSizeProp</code>	Numeric: Expected proportion of zero effect size
<code>eCovarsPerRow</code>	Number: Effective number of non-zero covariates per data row
<code>model</code>	String: Simulation model. Choices are: <code>logistic</code> , <code>poisson</code> or <code>survival</code>

## Value

A simulated data set

## Examples

```
#Generate some simulated data:
sim <- simulateCyclopsData(nstrata = 1, nrows = 1000, ncovars = 2, eCovarsPerRow = 0.5,
                           model = "poisson")
cyclopsData <- convertToCyclopsData(sim$outcomes, sim$covariates, modelType = "pr",
                                      addIntercept = TRUE)

#Define the prior and control objects to use cross-validation for finding the
#optimal hyperparameter:
prior <- createPrior("laplace", exclude = 0, useCrossValidation = TRUE)
control <- createControl(cvType = "auto", noiseLevel = "quiet")

#Fit the model
fit <- fitCyclopsModel(cyclopsData,prior = prior, control = control)

#Find out what the optimal hyperparameter was:
getHyperParameter(fit)

#Extract the current log-likelihood, and coefficients
logLik(fit)
coef(fit)

#We can only retrieve the confidence interval for unregularized coefficients:
confint(fit, c(0))
```

**splitTime**

*Split the analysis time into several intervals for time-varying coefficients.*

## Description

`splitTime` split the analysis time into several intervals for time-varying coefficients

## Usage

```
splitTime(shortOut, cut)
```

## Arguments

<code>shortOut</code>	A data frame containing the outcomes with predefined columns (see below).
<code>cut</code>	Numeric: Time points to cut at
These columns are expected in the <code>shortOut</code> object:	
<code>rowId</code> (integer)	Row ID is used to link multiple covariates (x) to a single outcome (y)
<code>y</code> (real)	Observed event status
<code>time</code> (real)	Observed event time

**Value**

A long outcome table for time-varying coefficients.

---

summary.cyclopsData     *Cyclops data object summary*

---

**Description**

summary.cyclopsData summarizes the data held in an Cyclops data object.

**Usage**

```
## S3 method for class 'cyclopsData'  
summary(object, ...)
```

**Arguments**

object	A Cyclops data object
...	Additional arguments

**Value**

Returns a data.frame that reports simply summarize statistics for each covariate in a Cyclops data object.

---

survfit.cyclopsFit     *Calculate baseline hazard function*

---

**Description**

survfit.cyclopsFit computes baseline hazard function

**Usage**

```
## S3 method for class 'cyclopsFit'  
survfit(formula, type = "aalen", ...)
```

**Arguments**

formula	A Cyclops survival model fit object
type	type of baseline survival, choices are: "aalen" (Breslow) for future methods
...	

**Value**

Baseline survival function for mean covariates

`vcov.cyclopsFit`      *Calculate variance-covariance matrix for a fitted Cyclops model object*

---

## Description

`vcov.cyclopsFit` returns the variance-covariance matrix for all covariates of a Cyclops model object

## Usage

```
## S3 method for class 'cyclopsFit'  
vcov(object, control, overrideNoRegularization = FALSE, ...)
```

## Arguments

<code>object</code>	A fitted Cyclops model object
<code>control</code>	A "cyclopsControl" object constructed by <code>createControl</code>
<code>overrideNoRegularization</code>	Logical: Enable variance-covariance estimation for regularized parameters
<code>...</code>	Additional argument(s) for methods

## Value

A matrix of the estimates covariances between all covariate estimates.
