# Package 'PUlasso' 

December 18, 2023

## Type Package

Title High-Dimensional Variable Selection with Presence-Only Data
Version 3.2.5
Date 2023-12-18
Description Efficient algorithm for solving PU (Positive and Unlabeled) problem in low or high dimensional setting with lasso or group lasso penalty. The algorithm uses Maximization-
Minorization and (block) coordinate descent. Sparse calculation and parallel computing are supported for the computational speed-up. See Hyebin Song, Garvesh Raskutti (2018) [arXiv:1711.08129](arXiv:1711.08129).

License GPL-2
Imports Rcpp (>=0.12.8), methods, Matrix, doParallel, foreach, ggplot2

Depends R(>=2.10)
LinkingTo Rcpp, RcppEigen, Matrix
RoxygenNote 7.2.3

PUlasso-package PUlasso : An efficient algorithm to solve Positive and Unlabeled (PU) problem with lasso or group lasso penalty

## Description

The package efficiently solves PU problem in low or high dimensional setting using MaximizationMinorization and (block) coordinate descent. It allows simultaneous feature selection and parameter estimation for classification. Sparse calculation and parallel computing are supported for the further computational speed-up. See Hyebin Song, Garvesh Raskutti (2018) <https://arxiv.org/abs/ 1711.08129>.

## Details

Main functions: grpPUlasso, cv.grpPUlasso, coef, predict

## Author(s)

Hyebin Song, [hsong@stat.wisc.edu](mailto:hsong@stat.wisc.edu), Garvesh Raskutti, [raskutti@stat.wisc.edu](mailto:raskutti@stat.wisc.edu).

## Examples

```
data("simulPU")
fit<-grpPUlasso(X=simulPU$X,z=simulPU$z,py1=simulPU$truePY1)
## Not run:
cvfit<-cv.grpPUlasso(X=simulPU$X,z=simulPU$z,py1=simulPU$truePY1)
## End(Not run)
coef(fit,lambda=fit$lambda[10])
predict(fit,newdata = head(simulPU$X), lambda= fit$lambda[10],type = "response")
```

## Description

Do a n-fold cross-validation for PUlasso.

## Usage

```
cv.grpPUlasso(
        X,
        z,
        py1,
        initial_coef = NULL,
        group = 1:p,
        penalty = NULL,
        lambda = NULL,
        nlambda = 100,
        lambdaMinRatio = ifelse(N < p, 0.05, 0.005),
        maxit = ifelse(method == "CD", 1000, N * 10),
        weights = NULL,
        eps = 1e-04,
        inner_eps = 0.01,
        verbose = FALSE,
        stepSize = NULL,
    stepSizeAdjustment = NULL,
    batchSize = 1,
    updateFrequency = N,
    samplingProbabilities = NULL,
    method = c("CD", "GD", "SGD", "SVRG", "SAG"),
    nfolds = 10,
    fitInd = 1:nfolds,
    nCores = 1,
    trace = c("none", "param", "fVal", "all")
)
```

## Arguments

X
z Response vector representing whether an observation is labeled or unlabeled.
py1 True prevalence $\operatorname{Pr}(\mathrm{Y}=1)$
initial_coef A vector representing an initial point where we start PUlasso algorithm from.
group A vector representing grouping of the coefficients. For the least ambiguity, it is recommended if group is provided in the form of vector of consecutive ascending integers.

| penalty | penalty to be applied to the model. Default is sqrt(group size) for each of the <br> group. |
| :--- | :--- |
| lambda | A user supplied sequence of lambda values. If unspecified, the function auto- <br> matically generates its own lambda sequence based on nlambda and lambdaMin- <br> Ratio. |
| nlambda | The number of lambda values. |
| lambdaMinRatio | Smallest value for lambda, as a fraction of lambda.max which leads to the inter- <br> cept only model. |
| maxit | Maximum number of iterations. |
| weights | observation weights. Default is 1 for each observation. <br> eps |
| Convergence threshold for the outer loop. The algorithm iterates until the max- |  |
| imum change in coefficients is less than eps in the outer loop. |  |

## Value

cvm Mean cross-validation error
cvsd Estimate of standard error of cvm
cvcoef Coefficients for each of the fitted CV models
cvstdcoef Coefficients in a standardized scale for each of the fitted CV models
lambda The actual sequence of lambda values used.
lambda.min Value of lambda that gives minimum cvm.
lambda. 1 se The largest value of lambda such that the error is within 1 standard error of the minimum cvm.

PUfit A fitted PUfit object for the full data

## Examples

data("simulPU")
fit<-cv.grpPUlasso(X=simulPU\$X,z=simulPU\$z, py1=simulPU\$truePY1)

```
deviances Deviance
```

## Description

Calculate deviances at provided coefficients

## Usage

deviances(X, z, py1, coefMat, weights = NULL)

## Arguments

| X | Input matrix |
| :--- | :--- |
| z | Response vector |
| py1 | True prevalence $\operatorname{Pr}(\mathrm{Y}=1)$ |
| coefMat | A coefficient matrix whose column corresponds to a set of coefficients |
| weights | observation weights. Default is 1 for each observation. |

## Value

deviances

## Examples

```
data("simulPU")
coef0<-replicate(2,runif(ncol(simulPU$X)+1))
deviances(simulPU$X,simulPU$z,py1=simulPU$truePY1,coefMat = coef0)
```

## Description

Fit a model using PUlasso algorithm over a regularization path. The regularization path is computed at a grid of values for the regularization parameter lambda.

## Usage

```
grpPUlasso(
    X,
    z,
    py1,
    initial_coef = NULL,
    group = 1:ncol(X),
    penalty = NULL,
    lambda = NULL,
    nlambda = 100,
    lambdaMinRatio = ifelse(N < p, 0.05, 0.005),
    maxit = ifelse(method == "CD", 1000, N * 10),
    maxit_inner = 1e+05,
    weights = NULL,
    eps = 1e-04,
    inner_eps = 0.01,
    verbose = FALSE,
    stepSize = NULL,
    stepSizeAdjustment = NULL,
    batchSize = 1,
    updateFrequency = N,
    samplingProbabilities = NULL,
    method = c("CD", "GD", "SGD", "SVRG", "SAG"),
    trace = c("none", "param", "fVal", "all")
)
```

## Arguments

| X | Input matrix; each row is an observation. Can be a matrix or a sparse matrix. |
| :--- | :--- |
| z | Response vector representing whether an observation is labeled or unlabeled. |
| py1 | True prevalence $\operatorname{Pr}(\mathrm{Y}=1)$ |
| initial_coef | A vector representing an initial point where we start PUlasso algorithm from. |
| group | A vector representing grouping of the coefficients. For the least ambiguity, it is <br> recommended if group is provided in the form of vector of consecutive ascend- <br> ing integers. |
| penalty | penalty to be applied to the model. Default is sqrt(group size) for each of the <br> group. |

| lambda | A user supplied sequence of lambda values. If unspecified, the function auto- <br> matically generates its own lambda sequence based on nlambda and lambdaMin- <br> Ratio. |
| :--- | :--- |
| nlambda | The number of lambda values. |
| lambdaMinRatio |  | | Smallest value for lambda, as a fraction of lambda.max which leads to the inter- |
| :--- |
| cept only model. |
| maxit |
| maxit_inner |$\quad$| Maximum number of iterations for a quadratic sub-problem for CD. |
| :--- |

## Value

coef A p by length(lambda) matrix of coefficients
std_coef A p by length(lambda) matrix of coefficients in a standardized scale
lambda The actual sequence of lambda values used.
nullDev Null deviance defined to be $2 *$ (logLik_sat -logLik_null)
deviance Deviance defined to be $2 *\left(\operatorname{logLik} \_\right.$sat $-\log \operatorname{Lik}($ model $\left.)\right)$
optResult A list containing the result of the optimization. fValues, subGradients contain objective function values and subgradient vectors at each lambda value. If trace = TRUE, corresponding intermediate quantities are saved as well.
iters Number of iterations(EM updates) if method $=$ "CD". Number of steps taken otherwise.

## Examples

```
data("simulPU")
fit<-grpPUlasso(X=simulPU$X,z=simulPU$z,py1=simulPU$truePY1)
```

```
simulPU simulated PU data
```

## Description

A simulated data for the illustration. Covariates $x_{i}$ are drawn from $N\left(\mu, I_{5 \times 5}\right)$ or $N\left(-\mu, I_{5 \times 5}\right)$ with probability 0.5 . To make the first two variables active, $\mu=\left[\mu_{1}, \ldots, \mu_{2}, 0,0,0\right]^{T}, \theta=\left[\theta_{0}, \ldots, \theta_{2}, 0,0,0\right]^{T}$ and we set $\mu_{i}=1.5, \theta_{i} \sim U n i f[0.5,1]$ Responses $y_{i}$ is simulated via $P_{\theta}(y=1 \mid x)=1 / \exp \left(-\theta^{T} x\right)$. 1000 observations are sampled from the sub-population of positives $(\mathrm{y}=1)$ and labeled, and another 1000 observations are sampled from the original population and unlabeled.

## Usage

data('simulPU')

## Format

A list containing model matrix $X$, true response $y$, labeled/unlabeled response vector $z$, and a true positive probability truePY1.
