

The `protecteddef` package

Heiko Oberdiek*

2016/05/16 v1.1

Abstract

This packages provides `\ProtectedDef` for defining robust macros for both plain \TeX and \LaTeX . First $\varepsilon\text{-}\text{\TeX}$'s `\protected` is tried, then \LaTeX 's `\DeclareRobustCommand` is used. Otherwise the macro is not made robust.

1 Documentation

Many of my packages work for both formats plain \TeX and \LaTeX , even $\text{ini}\text{\TeX}$ is often supported. It would be nice if fragile macros could be protected and made robust. However the different format worlds offer different solutions.

*Please report any issues at <https://github.com/ho-tex/oberdiek/issues>

1.1 The L^AT_EX's way

Usually `\newcommand` is used to define macros. It provides a check if the command to be defined is already defined or cannot be defined for other reasons.

For making robust macros L^AT_EX provides `\DeclareRobustCommand`. It shares the syntax with `\newcommand`. However it does not provide latters check. Internally the check is available via `\@ifdefinable`.

Internally the robust macro is using `\protect` with a nested macro definition. The `\protect` infrastructure is a feature of L^AT_EX and usually not available in other formats.

1.2 The ε-T_EX's way

The need for robust macros is addressed in L^AT_EX. It provides `\protected` that modifies the behaviour of `\def` in a similar way as `\long`. A protected macro does not expand in some expandable contexts like writing to a file or `\edef`.

1.3 The way of this package

The package tries to find the available protection mechanism. First it looks for L^AT_EX's `\protected`, then it uses L^AT_EX's `\DeclareRobustCommand`. If both fails, then the macro remains unprotected.

Additionally, L^AT_EX's check, if a macro is already defined is added in all cases. First L^AT_EX's `\@ifdefinable` is tried to be compatible with L^AT_EX. If `\@ifdefinable` is not available, then the test is implemented by asserting that the macro is undefined or has the meaning of `\relax`. If the test fails, then in all cases the macro is not defined and an error is thrown.

1.4 Usage

```
\ProtectedDef * {⟨cmd⟩} [⟨num⟩] {⟨definition text⟩}
```

Macro `\ProtectedDef` follows the syntax of L^AT_EX's `\newcommand` with the exception that an optional argument is not supported. Macro `⟨cmd⟩` is to be defined as `\long` macro without star with `⟨num⟩` arguments.

The number of arguments `⟨num⟩` must be given as explicit digit 0 upto 9. Otherwise the part between the argument `⟨cmd⟩` and the `⟨definition text⟩` is taken as parameter text in the syntax of vanilla T_EX. Examples (with `\protected`):

```
\ProtectedDef*\{⟨cmd⟩}[1]{⟨message#1⟩}
⇒ \protected\def⟨cmd⟩#1{⟨message#1⟩}

\ProtectedDef⟨cmd⟩[abc]
⇒ \protected\def⟨cmd⟩{abc}

\ProtectedDef*\{⟨cmd⟩}[1]<#2>{⟨#1/#2⟩}
⇒ \protected\def⟨cmd⟩{⟨#1/#2⟩}
```

2 Implementation

¹ `⟨*package⟩`

2.1 Reload check and package identification

Reload check, especially if the package is not used with L^AT_EX.

```

3 Installation

3.1 Download

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/protecteddef.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/protecteddef.pdf Documentation.

¹CTAN/pkg/protecteddef

Bundle. All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for \TeX Files” ([CTAN:pkg/tds](#)). Directories with `texmf` in their name are usually organized this way.

3.2 Bundle installation

Unpacking. Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

3.3 Package installation

Unpacking. The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain \TeX :

```
tex protecteddef.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
protecteddef.sty → tex/generic/oberdiek/protecteddef.sty  
protecteddef.pdf → doc/latex/oberdiek/protecteddef.pdf  
protecteddef.dtx → source/latex/oberdiek/protecteddef.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`’s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

3.4 Refresh file name databases

If your \TeX distribution ($\text{\TeX} \text{Live}$, $\text{MiK}\text{\TeX}$, ...) relies on file name databases, you must refresh these. For example, $\text{\TeX} \text{Live}$ users run `texhash` or `mktexlsr`.

3.5 Some details for the interested

Unpacking with L^AT_EX. The `.dtx` chooses its action depending on the format:

plain \TeX : Run `docstrip` and extract the files.

L^AT_EX: Generate the documentation.

If you insist on using L^AT_EX for `docstrip` (really, `docstrip` does not need L^AT_EX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{protecteddef.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL^AT_EX:

```
pdflatex protecteddef.dtx  
makeindex -s gind.ist protecteddef.idx  
pdflatex protecteddef.dtx  
makeindex -s gind.ist protecteddef.idx  
pdflatex protecteddef.dtx
```
